Stability Study Report

Document ID: STB-001 | **Version:** v1.0 | **Effective Date:** 2025-10-30 | **Author:** Dr. Meera Iyer

1. Study Objective and Experimental Design

This stability report summarizes long-term and accelerated stability testing for commercial vaccine product lots manufactured at Novacure Labs. Dr. Meera Iyer, QA Head, supervised the study and approved the stability protocol.

2. Storage Conditions and Assay Results

Long-term stability lots were maintained at 2 to 8 °C in qualified walk-in cold chambers over a 36-month monitoring period. Potency, pH, sterility, and aggregate levels met all pre-specified acceptance criteria across all evaluated time points.

3. Thermal Stress Challenge Analysis

Accelerated excursion testing showed that vaccine potency remains within specification during temporary thermal stress events, provided total cumulative excursion duration does not exceed validated critical thresholds.

4. Conclusion and Shelf-Life Recommendation

Based on real-time 36-month stability data, the commercial shelf life is confirmed as 24 months when stored at 2 to 8 °C. Continued routine annual stability pull testing is mandated.
